

Bonus: Responsible AI Usage Notes

During this assignment, I used AI tools as a helper to speed up small, repetitive parts of the work.

Examples:

- Quick syntax reminders (TypeScript/Playwright APIs)
- Alternative locator ideas when a selector felt unstable
- Sanity-checking edge cases for request validations in Postman tests

What I did NOT outsource:

- Test scenario selection and coverage decisions
- The core validation logic (price calculation checks, negative cases)
- Page Object structure and naming

In short: AI was used like a faster search engine, while design decisions and final checks were done manually.
